# Nonparametric Statistics Notes 

# Chapter 4: Contingency Tables 

Jesse Crawford

Department of Mathematics<br>Tarleton State University

## Definition

- Let $Z_{1}, \ldots, Z_{k}$ be IID $N(0,1)$ random variables.
- $Y=Z_{1}^{2}+\cdots+Z_{k}^{2}$ has a chi-squared distribution with $k$ degrees of freedom.
- $Y \sim \chi^{2}(k)$

## Outline

(1) Sections 4.1 and 4.2: Chi-squared Tests for Contingency Tables
(2) Section 4.3: The Median Test
(3) Section 4.4: Measures of Dependence
4. Section 4.5: Chi-squared Goodness-of-Fit Tests
(5) Section 4.6: Cochran's $Q$-Test for Related Observations

## Testing for Differences in Probabilities ( $2 \times 2$ case)

Testing for Differences in Probabilities ( $2 \times 2$ case)

- Assumptions:

The random samples are statistically independent.
$p_{1}=P($ Class 1) in Population 1
$p_{2}=P($ Class 1$)$ in Population 2
Row totals are fixed. Column totals are random.

- Testing problems:

$$
\begin{array}{ll}
\mathrm{H}_{0}: p_{1}=p_{2} \text { vs. } \mathrm{H}_{1}: p_{1} \neq p_{2} & \text { (Two-tailed) } \\
\mathrm{H}_{0}: p_{1} \geq p_{2} \text { vs. } \mathrm{H}_{1}: p_{1}<p_{2} & \text { (Lower-tailed) } \\
\mathrm{H}_{0}: p_{1} \leq p_{2} \text { vs. } \mathrm{H}_{1}: p_{1}>p_{2} & \text { (Upper-tailed) }
\end{array}
$$

## Testing for Differences in Probabilities ( $2 \times 2$ case)

- Test statistic:

$$
T=\frac{\sqrt{N}\left(O_{11} O_{22}-O_{12} O_{21}\right)}{\sqrt{n_{1} n_{2} C_{1} C_{2}}}
$$

- Null distribution: $T \approx N(0,1)$
- $p$-values:

$$
\begin{gathered}
2 \cdot \min \left[P\left(Z \leq t_{\mathrm{obs}}\right), P\left(Z \geq t_{\mathrm{obs}}\right)\right] \quad \text { (Two-tailed) } \\
P\left(Z \leq t_{\mathrm{obs}}\right) \quad(\text { Lower-tailed }) \\
P\left(Z \geq t_{\mathrm{obs}}\right) \quad \text { (Upper-tailed) }
\end{gathered}
$$

Testing for Differences in Probabilities ( $2 \times 2$ case)

|  | Class 1 | Class 2 | Total |
| :---: | :---: | :---: | :---: |
| Population 1 | $O_{11}$ | $\mathrm{O}_{12}$ | $n_{1}$ |
| Population 2 | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ | $n_{2}$ |
| Total | $C_{1}$ | $C_{2}$ | $N=n_{1}+n_{2}$ |

- Expected cell frequencies under $\mathrm{H}_{0}$ :

$$
E_{i j}=\frac{n_{i} C_{j}}{N}
$$

- Chi-squared Statistic:

$$
\chi^{2}=\sum_{i=1}^{r} \sum_{j=1}^{c} \frac{\left(O_{i j}-E_{i j}\right)^{2}}{E_{i j}}=\left[\sum_{i=1}^{r} \sum_{j=1}^{c} \frac{O_{i j}^{2}}{E_{i j}}\right]-N
$$

## Testing for Differences in Probabilities ( $2 \times 2$ case)

|  | Class 1 | Class 2 | Total |
| :---: | :---: | :---: | :---: |
| Population 1 | $O_{11}$ | $\mathrm{O}_{12}$ | $n_{1}$ |
| Population 2 | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ | $n_{2}$ |
| Total | $C_{1}$ | $C_{2}$ | $N=n_{1}+n_{2}$ |

- Chi-squared Statistic:

$$
\chi^{2}=\sum_{i=1}^{r} \sum_{j=1}^{c} \frac{\left(O_{i j}-E_{i j}\right)^{2}}{E_{i j}}=\left[\sum_{i=1}^{r} \sum_{j=1}^{c} \frac{O_{i j}^{2}}{E_{i j}}\right]-N
$$

- Null distribution: $\chi^{2} \approx \chi^{2}(1) \quad$ (Degrees of freedom $=1$ )
- p-value: $P\left(\chi^{2} \geq \chi_{\text {obs }}^{2}\right)$ (Two-tailed test only)

## When is the Chi-squared Distribution a Good Approximation?

- Cochran's Criterion: The approximation may be poor if
- Any $E_{i j}$ is less than 1 , or
- more than $20 \%$ of the $E_{i j}$ 's are less than 5
- Conover's Criterion: The approximation may be poor if
- Any $E_{i j}$ is less than 0.5 , or
- more than $50 \%$ of the $E_{i j}$ 's are less than 1

## Testing for Differences in Probabilities ( $r \times c$ case)

Testing for Differences in Probabilities ( $r \times c$ case)
Class 1 Class 2 ... Class $c$ Total

| Population 1 | $\mathrm{O}_{11}$ | $\mathrm{O}_{12}$ | $\cdots$ | $\mathrm{O}_{10}$ | $n_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Population 2 | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ | $\ldots$ | $\mathrm{O}_{2 \mathrm{c}}$ | $n_{2}$ |
| $\vdots$Population r | : | : | $\because$ | : |  |
|  | $O_{r 1}$ | $\mathrm{O}_{\mathrm{r} 2}$ | $\cdots$ | $O_{r c}$ | $n_{r}$ |
| Total | $C_{1}$ | $\mathrm{C}_{2}$ |  | $C_{c}$ | $N$ |

- Assumptions:

The random samples are statistically independent.

$$
p_{i j}=P(\text { Class } j) \text { in Population } i
$$

Row totals are fixed. Column totals are random.

- Two-tailed Testing problem:
$\mathrm{H}_{0}$ : All probabilities in the same column are equal to each other

$$
\left(p_{1 j}=p_{2 j}=\cdots=p_{r j}, \text { for all } j\right)
$$

Testing for Differences in Probabilities ( $r \times c$ case)

|  | Class | Class |  | Class | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Population 1 <br> Population 2 | $\mathrm{O}_{11}$ | $\mathrm{O}_{12}$ | $\ldots$ | $\mathrm{O}_{1 c}$ |  |
|  | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ | $\ldots$ | $\mathrm{O}_{2 c}$ | $n_{2}$ |
| : | $\vdots$ | $\vdots$ | $\because$ | : |  |
| Population r | $O_{r 1}$ | $O_{r 2}$ | $\ldots$ | $O_{r c}$ | $n_{r}$ |
| Total | $C_{1}$ | $C_{2}$ |  | $C_{c}$ | $N$ |

- $E_{i j}=\frac{n_{i} C_{j}}{N}$
- Chi-squared Statistic:

$$
\chi^{2}=\sum_{i=1}^{r} \sum_{j=1}^{c} \frac{\left(O_{i j}-E_{i j}\right)^{2}}{E_{i j}}=\left[\sum_{i=1}^{r} \sum_{j=1}^{c} \frac{O_{i j}^{2}}{E_{i j}}\right]-N
$$

- Null distribution: $\chi^{2} \approx \chi^{2}[(r-1)(c-1)]$
- p-value: $P\left(\chi^{2} \geq \chi_{\text {obs }}^{2}\right)$ (Two-tailed test only)

## Example

- Website visitors were shown three different website layouts.
- 100 were shown layout 1
- 50 were shown layout 2
- 200 were shown layout 3
- Time spent browsing was also recorded.

|  | $T \leq 5$ |  | $5<T \leq 10$ | $10 \leq T<15$ |
| :---: | :---: | :---: | :---: | :---: |
| Layout 1 $15 \leq T$ |  |  |  |  |
|  | 55 | 27 | 11 | 7 |
| Layout 2 | 16 | 23 | 6 | 5 |
| Layout 3 | 40 | 71 | 22 | 17 |
|  |  |  |  |  |

- Test the null hypothesis that the probability distribution of time spent browsing is the same for the different layouts.
- Note: Row totals are fixed, and column totals are random.

## Testing for Independence ( $r \times c$ case)

|  | Column 1 |  | Column 2 | $\cdots$ | Column c |
| :---: | :---: | :---: | :--- | :---: | :---: |
| Row 1 |  |  |  |  |  |
|  | $O_{11}$ | $O_{12}$ | $\cdots$ | $O_{1 c}$ | $R_{1}$ |
| Row 2 | $O_{21}$ | $O_{22}$ | $\cdots$ | $O_{2 c}$ | $R_{2}$ |
|  | $\vdots$ | $\vdots$ | $\ddots$ | $\vdots$ | $\vdots$ |
| Row r | $O_{r 1}$ | $O_{r 2}$ | $\cdots$ | $O_{r c}$ | $R_{r}$ |
| Total | $C_{1}$ | $C_{2}$ | $\cdots$ | $C_{c}$ | $N$ |

- Assumptions:

Random sample of $N$ observations.
Each observation is a member of exactly one of the $r$ rows and one of the $c$ columns.
Both the row and column totals are random.

- Two-tailed Testing problem:
$\mathrm{H}_{0}: P($ row $i$, column $j)=P($ row $i) \cdot P($ column $j)$, for all $i, j$.
- Testing procedure is the same as the previous test.

## Chi-squared Test with Fixed Marginal Totals.

|  | Column 1 | Column 2 | ... | Column c | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Row 1 | $O_{11}$ | $\mathrm{O}_{12}$ | $\cdots$ | $\mathrm{O}_{1 c}$ | $n_{1}$ |
| Row 2 | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ | $\cdots$ | $\mathrm{O}_{2 \mathrm{c}}$ | $n_{2}$ |
| : | $\vdots$ | $\vdots$ | $\ddots$. | $\vdots$ | : |
| Row r | $O_{r 1}$ | $O_{r 2}$ | $\cdots$ | $O_{r c}$ | $n_{r}$ |
| Total | $c_{1}$ | $C_{2}$ |  | $c_{c}$ | $N$ |

- Assumptions:

Both the row and column totals are fixed.
The data were randomly selected from all contingency tables with those row and column totals.

- Chi-squared testing procedure is the same as the previous tests.

May perform poorly because row and column totals are both fixed. Need alternative methods.

## Chi-squared Test with Fixed Marginal Totals.

|  | Column 1 |  | Column 2 | $\cdots$ | Column $c$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Total |  |  |  |  |  |
| Row 1 | $O_{11}$ | $O_{12}$ | $\cdots$ | $O_{1 c}$ | $n_{1}$ |
| Row 2 | $O_{21}$ | $O_{22}$ | $\cdots$ | $O_{2 c}$ | $n_{2}$ |
|  | $\vdots$ | $\vdots$ | $\vdots$ | $\ddots$ | $\vdots$ |
| $\vdots$ |  |  |  |  |  |
| Row r n | $O_{r 1}$ | $O_{r 2}$ | $\cdots$ | $O_{r c}$ | $n_{r}$ |
| Total | $c_{1}$ | $c_{2}$ | $\cdots$ | $c_{c}$ | $N$ |

Alternatives to chi-squared test:

- $2 \times 2$ case:

Fisher's exact test.
Uses hypergeometric distribution to calculate exact $p$-value.
fisher.test(A)

- $r \times c$ case:

Simulate $p$-value.

```
chisq.test(A,simulate.p.value=TRUE)
```

## Outline

(1) Sections 4.1 and 4.2: Chi-squared Tests for Contingency Tables
(2) Section 4.3: The Median Test
(3) Section 4.4: Measures of Dependence
(4) Section 4.5: Chi-squared Goodness-of-Fit Tests
(5) Section 4.6: Cochran's $Q$-Test for Related Observations

## The Median Test

- Setting: Several independent random samples.
- Testing problem:
$\mathrm{H}_{0}$ :All populations have the same median vs.
$H_{1}$ :At least two have different medians.
- Testing procedure:

Grand Median = Median of all samples combined.

| Sample | 1 | 2 |  | $c$ | Totals |
| :---: | :---: | :---: | :---: | :---: | :---: |
| > Grand Median | $\mathrm{O}_{11}$ | $\mathrm{O}_{12}$ |  | $\mathrm{O}_{10}$ |  |
| $\leq$ Grand Median | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ |  | $\mathrm{O}_{2 \mathrm{c}}$ | b |
| Totals | $n_{1}$ | $n_{2}$ |  | $n_{c}$ |  |

Perform a chi-squared test.

| Sample | 1 | 2 |  | $c$ | Totals <br> a |
| :---: | :---: | :---: | :---: | :---: | :---: |
| > Grand Median | $O_{11}$ | $\mathrm{O}_{12}$ | $\cdots$ | $\mathrm{O}_{1 \mathrm{c}}$ |  |
| $\leq$ Grand Median | $\mathrm{O}_{21}$ | $\mathrm{O}_{22}$ | $\ldots$ | $\mathrm{O}_{2 \mathrm{c}}$ | $b$ |
| Totals | $n_{1}$ | $n_{2}$ |  | $n_{c}$ | $N$ |

## Example

- Corn yields for four different methods of growing corn:
- Method 1: 83, 89, 89, 90, 91, 91, 92, 94, 96
- Method 2: 81, 83, 83, 84, 84, 88, 89, 90, 91, 91
- Method 3: 91, 93, 94, 95, 96, 100, 101
- Method 4: 77, 78, 79, 80, 81, 81, 81, 82
- Test whether the medians for these different methods are equal.

## Outline

(1) Sections 4.1 and 4.2: Chi-squared Tests for Contingency Tables
(2) Section 4.3: The Median Test
(3) Section 4.4: Measures of Dependence

## 4) Section 4.5: Chi-squared Goodness-of-Fit Tests

(5) Section 4.6: Cochran's $Q$-Test for Related Observations

## Cramer's Contingency Coefficient

- Let $T=\chi^{2}$ be the chi-squared statistic from an $r \times c$ contingency table.
- $N=$ number of total observations in table.
- Let $q=\min (r, c)$
- The largest possible value of $T$ is $N(q-1)$

## Definition

$$
R_{1}=\frac{T}{N(q-1)}
$$

Cramer's Contingency Coefficient $=\sqrt{R_{1}}$

## Definition

$$
R_{1}=\frac{T}{N(q-1)}
$$

## Cramer's Contingency Coefficient $=\sqrt{R_{1}}$

## Interpretation of Cramer's Coefficient

$0 \leq$ Cramer's Contingency Coefficient $\leq 1$.

- A value of 1 suggests complete dependence.
- A value of 0 suggests complete independence.
- The $p$-value of a chi-squared test of independence is a more reliable measure.

## Outline

(1) Sections 4.1 and 4.2: Chi-squared Tests for Contingency Tables
(2) Section 4.3: The Median Test
(3) Section 4.4: Measures of Dependence

4 Section 4.5: Chi-squared Goodness-of-Fit Tests
(5) Section 4.6: Cochran's Q-Test for Related Observations

## Chi-squared Goodness-of-Fit Tests

- One random sample.
- Each observation is either in Class 1, Class 2, ..., or Class c.

| Class | 1 | 2 |  | C | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Observed Frequencies | $\mathrm{O}_{1}$ | $\mathrm{O}_{2}$ | $\ldots$ | $O_{C}$ | $N$ |

- $p_{j}=P($ Class $j)$
- $p_{j}^{\star}=P($ Class $j)$, under the null hypothesis
- $E_{j}=p_{j}^{\star} N$

$$
\chi^{2}=\left[\sum_{j=1}^{c} \frac{O_{j}^{2}}{E_{j}}\right]-N
$$

- $\chi^{2}$ has a chi-squared distribution.
- Degrees of freedom $=\operatorname{dim}\left(\mathrm{H}_{1}\right)-\operatorname{dim}\left(\mathrm{H}_{0}\right)$

## Outline

(1) Sections 4.1 and 4.2: Chi-squared Tests for Contingency Tables
(2) Section 4.3: The Median Test
(3) Section 4.4: Measures of Dependence
4. Section 4.5: Chi-squared Goodness-of-Fit Tests
(5) Section 4.6: Cochran's Q-Test for Related Observations

## Example

- 12 basketball games
- 3 basketball fans make predictions
- 1 = correct prediction
- $0=$ incorrect prediction

| Game | Fan 1 | Fan 2 | Fan 3 | Totals |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 1 | 1 | 3 |
| 2 | 1 | 1 | 1 | 3 |
| 3 | 0 | 1 | 0 | 1 |
| 4 | 1 | 1 | 0 | 2 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 11 | 1 | 1 | 1 | 3 |
| 12 | 1 | 1 | 1 | 3 |
| Totals | 8 | 10 | 7 | 25 |

- Is there a statistically significant difference in the accuracy of the three fans predictions?

## Cochran's Q-Test for Related Observations

|  | Treatments |  |  |  |  |
| :---: | :---: | :---: | :--- | :---: | :---: |
| Subjects | 1 | 2 | $\cdots$ | $c$ | Row Totals |
| 1 | $X_{11}$ | $X_{12}$ | $\cdots$ | $X_{1 c}$ | $R_{1}$ |
| 2 | $X_{21}$ | $X_{22}$ | $\cdots$ | $X_{2 c}$ | $R_{2}$ |
| $\vdots$ | $\vdots$ | $\vdots$ |  | $\vdots$ | $\vdots$ |
| $r$ | $X_{r 1}$ | $X_{r 2}$ | $\cdots$ | $X_{r c}$ | $R_{r}$ |
| Column Totals | $C_{1}$ | $C_{2}$ | $\cdots$ | $C_{c}$ | $N$ |

- Subjects are a large random sample from the population.
- $X_{i j}$ is either 1 or 0 .
- $p_{i j}=P\left(X_{i j}=1\right)$
- Testing problem:
$H_{0}$ : For each row $i, p_{i 1}=p_{i 2}=\cdots=p_{i c}$
$H_{0}$ : For every subject, all treatments are equally effective for that subject.

## Cochran's Q-Test for Related Observations

|  | Treatments |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Subjects | 1 | 2 | $\cdots$ | $c$ | Row Totals |
| 1 | $X_{11}$ | $X_{12}$ | $\cdots$ | $X_{1 c}$ | $R_{1}$ |
| 2 | $X_{21}$ | $X_{22}$ | $\cdots$ | $X_{2 c}$ | $R_{2}$ |
| $\vdots$ | $\vdots$ | $\vdots$ |  | $\vdots$ | $\vdots$ |
| $r$ | $X_{r 1}$ | $X_{r 2}$ | $\cdots$ | $X_{r c}$ | $R_{r}$ |
| Column Totals | $C_{1}$ | $C_{2}$ | $\cdots$ | $C_{c}$ | $N$ |

- $p_{i j}=P\left(X_{i j}=1\right)$
- $H_{0}$ : For each row $i, p_{i 1}=p_{i 2}=\cdots=p_{i c}$

$$
Q=c(c-1) \frac{\sum_{j=1}^{c}\left(C_{j}-\frac{N}{c}\right)^{2}}{\sum_{i=1}^{r} R_{i}\left(c-R_{i}\right)}
$$

- Null distribution: $T \sim \chi^{2}(c-1)$.

## Cochran's Q-Test with Two Treatments

- If there are only two treatments, Cochran's $Q$-test is equivalent to the McNemar test.
